

# care4all<sup>®</sup> Vehicle Protection

The Lommy is fitted to your vehicle.

The Lommy is customised online to your needs.

If the vehicle leaves the security radius, the Lommy contacts you.

- The Lommy is fitted to your vehicle and powered by the car's battery.
- Log on to your personal website through [care4all.ie](http://care4all.ie), using your username and password.
- From there you have complete control of the Lommy.
- You can decide which number the Lommy calls if the vehicle is stolen and leaves the security radius.
- You can also monitor the Lommy's location at anytime from any computer.

## Lommy – your new supplier of personal safety and peace of mind

### Basic Safe

Basic Safe is a low cost method of monitoring your personal property. The Lommy's GPS tracking technology ensures you will always know where your property is, even in the case of theft.

You'll be shown the position of your vehicle on a map or the position can be sent via SMS if you are away from a computer. The Basic Safe package also has a built-in speed control facility which will alert you if your vehicle goes faster than a certain speed (ask dealer for more information). As standard you have access to 30 days of historical data which enables you to study a vehicle's whereabouts over the past month.

The Lommy can be fitted to anything - cars, motorcycles, machinery, furniture - and can be programmed and monitored via your own private website.

- You can decide who should be notified and how, should a specific event occur (e.g. if your car has been stolen).
- You can upgrade services for a period of time – when you no longer require them, simply downgrade.

### Upgrades available:

- **Speed & Kilometre reports** (Letting you know the speed and the number of kilometres travelled by the vehicle)
- **Start/Stop reports** (When does a vehicle start, for how long is it driven, where does it stop and for how long?)

### GEO Fencing:

Care4all's GEO Fencing facility sets a boundary around the vehicle when the ignition is switched off. If the vehicle moves outside this area, you will automatically be notified. You can follow the movements of your vehicle via your personal website. This feature is especially important in the case of theft and greatly increases your chances of recovery. By activating the GEO Fencing via the website or by mobile you can activate it permanently. This means the vehicle can not be moved from its location with or without the key without you will receive an alert (is a use full feature when you go on holidays).

### Professional Monitoring Service

Care4all also provide a monitoring service for high valuable cars. The service is in accordance with the Government- & Insurance companies requirements.

The monitoring center responds to all alerts 24/7. In case of an alarm the monitoring center contacts you to clarify the alarm is not a false alarm. Thereafter they strictly follow procedures to insure the vehicle is recovered as quickly as possible in cooperation with the Police.

To insure the highest safety for people and property a number of personalized security measures are in place:

- Identification of the person called
- Exchange of passwords by voice or text (SMS)

The car will be equipped with GEO Fencing, panic button and another way of user identification then the car key to insure the highest standards.

### Operational safety:

The Lommy GPS tracking system is designed eliminate possible failures. That is why we are monitoring the external power source and the status of the backup battery as well. In the unlikely event of a problem we contact you so the necessary measures can be taken.

Please ask dealer for more information.

*Via the Lommy you can remotely switch on/off different appliances. This could for example be: switching off the car's fuel pump or activating the heating system in the car.*

## CASE STUDY

The Lommy meets all the requirements from insurance companies for a GPS tracker. Normally, a GPS tracker just sits there and only comes to use in case of a theft. With Lommy, you can keep track of your car 24/7. Through care4all's website you can see where the car has been and you can choose to receive a number of services by email or SMS. See example below.

A family man in Denmark uses Lommy in his car. Its primary task is to locate the car in case of theft. The car's own alarm is

connected up to the Lommy, so if somebody tampers with the car he will receive an SMS message telling him "the car alarm has been activated".

It does not matter if a thief can de-activate the car's alarm. When he tries to drive away, the Lommy will always alert the owner.

His son also uses his car every now and then. He and his son have an agreement that the son never drives faster than 100kph. Before he got the Lommy he never knew where his son took the car and how fast he was

going. By using one of the care4all services, he now receives an SMS or email if the car drives faster than 100kph. He also used what is known as "GEO Fencing" (GEO Fencing is a circle that the Lommy is allowed to move around in), which notifies him if his son leaves the agreed perimeter.

The care4all system can even let him know where the car stops and how many kilometers it has been driven. With a click of a button, you can change the services you use with the Lommy.
