

care4all[®] Machinery Protection

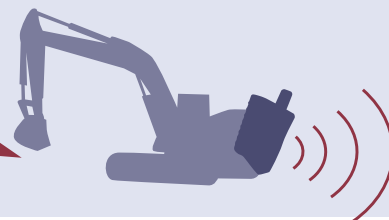

The Lommy is fitted to your machinery.

The Lommy is customised online to your needs.

If the machinery leaves the security radius (GEO Fencing), the Lommy contacts you.

- The Lommy is fitted to your machinery and powered by the machine's battery.
- Log on to your personal website through care4all.ie, using your username and password.
- From there you have complete control of the Lommy.
- You can decide which number the Lommy calls if the machinery is stolen or leaves the security radius.
- You can also monitor the Lommy's location at anytime from any computer.

Lommy – your new supplier of personal safety and peace of mind

Basic Safe

Basic Safe is a low cost method of monitoring your personal property. The Lommy's GPS tracking technology ensures you will always know where your property is, even in the case of theft.

You'll be shown the position of your property on a map or the position can be sent via SMS if you are away from a computer. The Basic Safe package also has a built-in speed control facility which will alert you if your machinery goes faster than a certain speed (ask dealer for more information). As standard you have access to 30 days of historical data which enables you to study a machinery's whereabouts over the past month.

The Lommy can be fitted to anything - cars, machinery, furniture - and can be programmed and monitored via your own private website.

- You can decide who should be notified and how, should a specific event occur (e.g. if your car has been stolen).
- You can upgrade services for a period of time – when you no longer require them, simply downgrade.

GEO Fencing:

Care4All's GEO fencing facility sets a boundary within which the Lommy is allowed to move. If the Lommy moves outside this area, you will automatically be notified. You can then follow the movements of your property via your personal website. This feature is especially important in the case of theft and greatly increases your chances of recovery. The GEO Fencing can be activated via the website or by mobile phone.

Basic Safe Machinery

Basic Safe Machinery is an effective monitoring solution for companies who want to keep track of their machinery, monitor the machinery's performance and secure it against theft. Basic Safe Machinery will show the position of your property on a map or can send the position via SMS if you are away from a computer. Also you can log on to your own website and follow the movements of your property. As standard you have access to 30 days of historical data, which allows you to study the machinery's whereabouts over the past month.

The Lommy can be programmed and monitored via your own private website, so changes can be made quickly and easily.

- You can decide who should be notified and how, should a specific event occur (e.g. if a machine has been stolen or powered off).
- You can upgrade services for a period of time. When you no longer need them, simply downgrade.
- You can generate reports on a daily, weekly or monthly basis.

Servicing the machinery:

The Basic Safe Machinery package allows you to keep track of the machine's service date. From your own website you can state how many hours the machine should work before the next service is due and you will be notified once these hours have passed (ask your dealer for more information).

Tracking working hours:

The Basic Safe Machinery package also enables you to track the amount of time for which the machine has been working. You can also set the machine's working hours from your website. This feature will alert you should the machine be used outside of its set working hours (e.g. if a machine is powered on at the weekends).

Reports available:

- **Start/Stop reports** (A report which generates the machine's start and stop times)
- **Location reports** (A report showing where the machinery has been during a working day)
- **End of rental report** (A report useful for plant hire companies which states how many hours the hired machinery has been working in total, where it has been during the time it has been rented out and how long there is left before the machine needs its next service).

GEO Fencing:

Care4All's GEO fencing facility sets a boundary within which the Lommy is allowed to move. If the Lommy moves outside this area, you will automatically be notified. You can then follow the movements of your property via your personal website. This feature is especially important in the case of theft and greatly increases your chances of recovery. The GEO Fencing can be activated via the website or by mobile phone.

CASE STUDY

After some machinery was stolen, a plant hire company contacted us to enquire how the Lommy could help prevent such incidents reoccurring.

Lommys were installed as part of the Basic Safe package. The Basic Safe package gave the company security, knowing that no machine could be moved off site without them being notified. They could also track

machinery even when it is on hire.

Three months later the company requested an upgrade to the Basic Safe Machinery package, which allowed them to see how many hours each machine had worked during hire periods.

Today the Basic Safe Machinery package plays a central role when a machine goes out on rent.

The company uses the system to inform them when the machinery needs to be serviced. They can see how many hours a customer has used a machine. The machine cannot be moved to another location without the company knowing about it. At the end of every rental they use the rental report to aid in costing the rental. As a result, they operate more cost-effectively and all their machinery performs more efficiently.
