

care4all[®] Valuable Goods

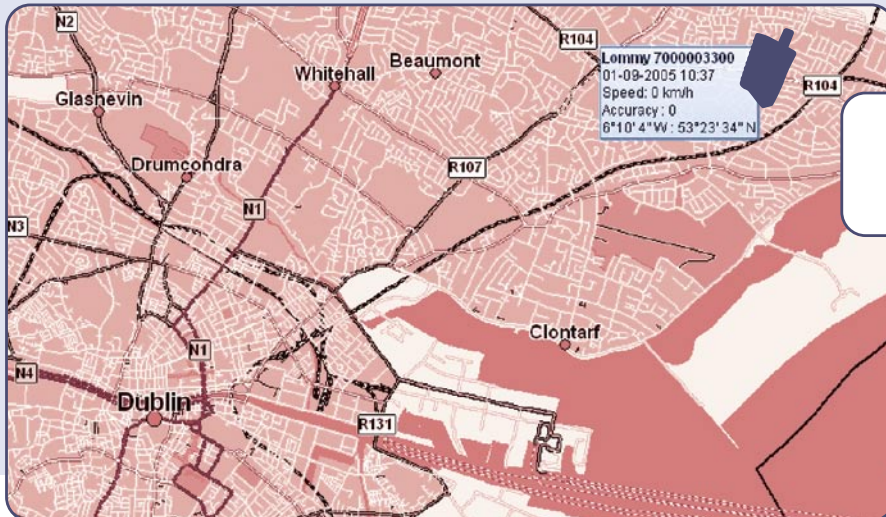

The Lommy is fitted to your valuable goods.

The Lommy is customised online to your needs.

Your goods are easily tracked online while in transit and can be located if stolen.

- *Attach the Lommy to the valuable goods.*
- *Track goods in transit.*
- *Aids quick recovery in case of theft.*
- *Allows customers or clients track deliveries.*
- *Monitor the Lommy's location at anytime from any computer.*
- *A geo-fencing facility alerts you if the Lommy leaves a set perimeter.*

Lommy – your new supplier of personal safety and peace of mind

How It Works

The Lommy is given to an individual user or fastened to a machine, vehicle or to the valuable goods in question. To monitor the location of the Lommy you simply log on to your personalised website via care4all.ie. Simply enter your username and password and you will be able to see the location of the Lommy on a map.

Advanced Intelligence

The Lommy has an intelligent motion sensor that will alert the alarm centre or monitor if it is tipped on its side. This is an extremely useful feature for goods which can only be transported in an upright position.

Safety First

The advanced antenna, combined with the ground-breaking Helix satellite receiver allows the Lommy to find its exact geographical location. This sets the Lommy apart from other units and along with its indoor capabilities, it gives the user complete confidence and security.

Simple Set Up

The Lommy is set up via your personalised website which is automatically installed under care4all.ie. This means you can monitor movement and location of the Lommy from any computer with an internet connection. You can also change its features to suit the individual's requirements e.g. change the number the Lommy calls for help and choose how often and to whom the Lommy transmits its location.

Long Battery Life

The ultra efficient Lommy uses a high capacity lithium ion battery to give it incredible battery life. With frequent positioning and talk time, the Lommy can stay active for up to 24 hours. Prolonged battery life of up to several days can be gained by reducing the frequency of location transmissions throughout the day. If used to track vehicles, the Lommy can draw power from the vehicle's battery.

Low Running Costs

The Lommy delivers its data via GPRS, making it a much cheaper and faster form of communication than previous devices. It also means that the Lommy and its user are always in contact with the central service software which enables rapid return answers. A package solution from care4all will always compare favourably with competitors, not only in initial investment, but in the long term running costs.

Small But Tough

The Lommy's advanced technology is encased in a shockproof ABS-plastic shell so it can withstand use in all conditions and environments. The battery can be charged quickly and easily and has a lifespan of between 500 - 1000 charges. The Lommy can even be used on boats and boating equipment with the fitting of a waterproof shell.

CASE STUDY

A company that specialises in moving valuable goods is now using Lommy and Care4all. They conceal a Lommy in each shipment. Previously, they placed a GPS tracker on the truck – not

much use if the goods are moved from the truck. Now the company can track the goods incase of theft because the Lommy still works if it is stored in the packaging. We have even been asked

to build the Lommy into a bundle of money. The money can then be easily tracked and recovered incase of a robbery.
